

INTRODUCTION

A number of mocked-up roof drain assemblies equipped with the Thaler Super-Seal EPDM sealing ring gasket were tested to establish at what pressure water bypassed the installed Super-Seal ring. Each of the mock-up samples consisted of:

- a 12" (305 mm) long steel "drain pipe leader" with a flat plate welded onto the bottom of the pipe.
- a 9" (229 mm) long copper "drain outlet pipe" with the top capped with a copper plate equipped with two nipples soldered to the plate (one nipple for introducing air pressure and the other nipple to monitor the supplied pressure). The bottom of the "outlet" was fitted with the Thaler Super-Seal EPDM sealing ring.

PROCEDURE

Each "leader" was filled with water to a level 1/2" (12 mm) below the top edge of the "leader".

The copper "drain outlet" with silicone lubricated Super-Seal ring was then inserted into the steel "leader" and secured using a threaded rod attached to the top and bottom plates to prevent the two components from separating during testing.

Air pressure was applied using a regulated electric air pump or regulated shop service, as required. Pressure was monitored using a calibrated 0" to 200" H₂O Merical digital manometer or calibrated Matheson 0 to 30 psi gauge, as required. Air pressure was slowly introduced into each assembly until visible water leakage was noted around the Super-Seal EPDM sealing ring. The pressure at which leakage was observed was then noted. The results are shown in the chart below.

** A cubic foot (28.32 L) of water weighs approximately 62.4 lbs (28.3 Kg). A one-inch (25 mm) high column of water exerts a pressure of 1/1728 of 62.4 (28.3 Kg) or .361 lbs (1.64 Kg) on one square inch (645 mm²).

On one square foot (0.0929 m²) the load is 1/12 of 62.4 (28.3 Kg) or 5.2 lbs (2.36 Kg). Stated another way, the measurement of a static head of 1" (25 mm) water column equals 5.2 psf or 0.036 psi (0.670 kPa or 0.248 kPa) pressure. The conversion factor for 1 inch of water (H₂O) column (20°C, 68°F) is 3 374.110 Pa or 3.374 110 kPa.
